hMOF
hMOF-31782
the same crystal
The resolution
identity settled on the structure, provenance kept per value
Adapt
one record per entry, with its unit, its method and its owned identifiers
Fingerprint
the primitive cell reduced to one invariant string, never the formula
Match
an owned identifier first, the fingerprint second, nothing else
Resolve
a hit annotates the crystal, a miss joins the pool
24%
every admitted crystal joins the substrate the next source is matched against: 24% of all 15.1M matches land there
The corpus
one row per crystal, every value traceable
one deduplicated database
14.59M unique crystal structures
131.8M property values
166 properties, 55 sources
1.20M stored spectra
3,233,769
crystals described by two or more sources
every value keeps its source, record and method
